WEST LAFAYETTE, INDIANA

No. 99

DECEMBER, 1933

## CROP SUMMARY FOR INDIANA FOR 1933

The acreage sown to winter wheat in the fall of 1932 was 8 per cent larger than that sown the previous fall. Seeding was later than usual due to excessive rains during September and October, which retarded seed bed preparation, and to the prevalence of Hessian Fly, which indicated the desirability of late seeding. The use of fertilizer was limited by price relationships. November was below normal in temperature most of the month and the condition of wheat on December 1 was 83 per cent of normal compared with a ten-year average of 86. While January was unusually warm, the temperature in months when growing temperatures are usually experienced were slightly colder than usual, so that growth of wheat was backward and plants were small on the first of April. Heavy spring rains were very favorable for the development of wheat diseases and the plants were badly infected until the extremely hot weather during June checked the spread of disease. This caused quick ripening and some wheat to shrivel and dry up rather than ripen. Considerable river bottom wheat was killed by May floods. The acreage actually abandoned for the state as a whole was 5 per cent of sowings. The state yield was below average, the west central and southern districts being most adversely affected. In general, quality of the grain was good and the moisture content low.

Rye for all purposes was sown on a 5 per cent smaller acreage in the fall of 1932 than in the fall of 1931. Growth was retarded by lack of high temperatures in April and May. Rye was thin, heads comparatively short and some of the acreage cut was rye pastured and intended for plowing up, but diverted to grain as salvage of plans when wet weather disrupted the spring work schedule. These factors resulted in a very low average yield for the state.

Oats seeding was delayed and hindered by wet weather. The intended acreage was not planted; seed bed conditions were unfavorable for much that was sown and the crop got a very poor start. Dry, hot weather during June and July damaged the already poor crop. Many fields were too short to cut with the binder and some were pastured. The average yield per acre at 17 bushels is lower than any yield harvested in the state since records began in 1866.

Barley was seeded late under unfavorable seed bed conditions and damaged by hot, dry weather in June and July, particularly in the northern districts. Chinch bugs caused much damage in some areas. Some acreage was actually abandoned because it was not worth cutting. The yield was the lowest on record.

During the winter months of 1932-33 corn prices ranged from 15 to 20 cents a bushel over most of the state. This unfavorable prospect caused farmers to plan about an 8 per cent decrease in acreage for 1933 as compared with 1932. Unfavorable weather for corn planting and a rise in the general price level caused marked improvement in corn prices in April and May. Hence, at corn planting time the price was conducive to a much larger acreage than originally intended, but climatic factors prevented this and the final result was about the same acreage as originally intended early in the spring. Wet weather delayed the beginning of corn planting and prolonged it greatly. The quick incidence of drought in June after the heavy rains in May put seed beds in poor condition. The result was poor stands and backward growth. Summer precipitation was showery and scanty. Corn was therefore uneven within short distances. Chinch bugs caused some damage in the northern part of the state. Damage from drought seemed imminent throughout the season over most of the state. Late rains were ample and a prolonged growing season permitted an unexpectedly large proportion of the crop to mature.

In general, ears were slender and in many cases poorly filled. The final yield per acre at 29.5 bushels was above earlier expectations, but considerably below the ten-year average of 34.6 bushels.

Buckwheat acreage was increased as a catch crop. Poor seed bed conditions and drouth resulted in yields below average.

The total acreage of all tame hay was about 3 per cent below a year ago. Clover, timothy and alfalfa were cut on a slightly larger acreage, but annual legume acreage was sharply reduced. Hay yields were below average as the drouth started so early that growth was not completed. Alfalfa as a long season crop was relatively more affected than clover and timothy. Clover made a very short second growth so seed acreages and yields were both reduced. Much new clover died of drouth in early summer.

Soybeans were planted in a sharply reduced acreage this year. An unusually wet May followed by a very dry June made seed beds very poor and stands thin in many fields that were too dry for proper germination. Considerable planting occurred after the first of July and many farmers never completed their intended seeding. Conditions for growth improved after the hay acreage was mature and beans for grain made nearly an average yield. The grain acreage was 18 per cent below the 1932 acreage and the hay acreage was 28 per cent below 1932. Cowpeas grown mainly in the southwest district had less adverse conditions than soybeans.

Early potato planting was hindered by weather conditions and growth was very adversely affected by the dry, hot weather of June and July. Many early potatoes hardly returned the seed. Late potatoes after a poor start had favorable conditions at the finish. Sweet potatoes in the principal district had nearly an average season.

Tobacco acreage was increased over last year. The crop was adversely affected by weather factors and the yield was considerably below average.

Spring freezes hurt apple and pear buds. Many peach buds were killed, but less extensively in the important producing districts. Wet weather early in the season was unfavorable for pollination. Scab was more prevalent than usual and the dropping of apples was rather heavy. Dry weather reduced the size of early fruit, but rains came in time so the late peaches were much superior in size to those harvested earlier. Peaches made less than half an average crop, apples and pears about half an average crop and grapes were about average. Berries were cut short by dry, hot weather in June and July.

Early truck crops suffered from wet weather first and then drouth. Late truck crops made fair yields.

Onion acreage was reduced and the yield was only half of last year.

The acreage of winter wheat sown in the fall of 1933 for harvest in 1934 was estimated at 1,671,000 acres or 103 per cent of last year's sown acreage. On December 1 the condition was reported 83 per cent of normal compared with a ten-year average of 86. Precipitation was below normal every month since July, except September, and wheat entered the winter rather short in growth.

The acreage of rye sown for all purposes is estimated at 198,000 acres or 165 per cent of last year's sown acreage. For the past two years less than half of the sown acreage has been harvested for grain, the remainder being utilized for pasture, hay and cover crops. The condition of rye on December 1 was 85 per cent of normal, 4 points below the ten-year average.

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE XXXVIII—INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

YEAR	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910.....	107	107	112	110	106	104	102	99	104	100	95	93	103

\*The index of prices paid by farmers is reported by years from 1910 to 1922 inclusive, by quarters from March, 1923 to June, 1933, and monthly thereafter. The monthly figures used for the early years were obtained by interpolating between the quarterly or annual figures.

## LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1933

The January 1, 1933, estimates of livestock on farms show increases for all cattle, milk cows and hogs, and decreases for horses, mules and all sheep as compared with a year ago.

When the numbers of all livestock are combined into animal units on the basis of feed requirements, this year's inventory is approximately 6 per cent larger than last year. Stocks of corn on Indiana farms on January 1, 1933, were about 4 per cent less than a year ago and stocks of oats about 10 per cent less. The 1932 hay crop was 8 per cent larger than that of 1931.

Declining prices have reduced inventory values below those of a year ago. The total value of all livestock on Indiana farms is \$88,585,000 or about 15 per cent below that of a year ago in spite of increased total numbers.

The number of horses continued to show the declining trend of the past several years although there were more colts on Indiana farms than a year ago. The number of all horses is 3 per cent below a year ago and 43 per cent less than in 1920. Mule numbers are 4 per cent less than last year and 17 per cent less than in 1920. Whereas, the prices of other classes of livestock are much lower than a year ago, horse and mule prices are about the same. The value per head of all horses was \$76.00 on January 1, 1931; \$73.00 on January 1, 1932, and \$72.00 on January 1, 1933. The value per head of all mules was \$83.00 on January 1, 1931; \$77.00 on January 1, 1932, and \$77.00 on January 1, 1933.

Numbers of all cattle are now 5 per cent above a year ago and 17 per cent above the number on farms in 1925 and 1926, the last low point in the cattle production cycle in Indiana. The number of milk cows has been increasing since 1923 and is now 19 per cent above the number on farms in 1923 and 3 per cent above a year ago. The number of yearling heifers kept for milk cows increased every year from 1925 to 1931 but has declined slightly the past two years, which indicates that the expansion of milk cow numbers has probably about reached its peak in this state. Extremely low feed prices, the need for cash and the low price of cull cows have all tended to swell cow numbers. Production per cow milked averaged about 4 per cent less in 1932 than in 1931 and is lower than for several years. The number of cattle on feed on January 1 was the same as a year ago. Receipts of cattle at public stockyards from Indiana in 1932 were 17 per cent larger than in 1931. Receipts of calves at public yards in 1932 were 12 per cent smaller than in 1931.

The average value per head of all cattle on January 1, 1933, was \$22.60 compared with \$30.40 last year and \$42.50 two years ago. The per head value of milk cows declined from \$39.00 a year ago to \$29.00 this January.

The number of all sheep was 5 per cent less than a year ago, the largest part of the decrease being in sheep and lambs on feed which were 12 per cent less on January 1 than the previous year. Stock sheep numbers declined 3 per cent in 1932. The per head value of all sheep on January 1, 1933, was \$3.30 compared with \$4.00 a year ago and \$5.70 two years ago.

The lamb crop of 1932 was 5 per cent smaller than in 1931 due to both fewer ewes and to a smaller proportion of lambs saved. Receipts of sheep and lambs at public stockyards in 1932 were 6 per cent greater than in 1931. The amount of wool shorn was 4 per cent smaller than the previous year. The average weight per fleece was 7.4 pounds in 1931 and 7.3 pounds in 1932.

Hog numbers are 21 per cent above a year ago due primarily to a large increase in the fall pig crop. Hog numbers reached a very low level two years ago due to several successive years of comparatively small corn production. The 1931 and 1932 corn crops of 184,626,000

bushels and 173,962,000 bushels respectively have not been equaled since 1926. In the corn surplus sections of the state the corn-hog ratio has been favorable for hog feeding most of the time for the past 18 months. Receipts of Indiana hogs at public stockyards was 7 per cent larger in 1932 than in 1931. There was some increase in the marketings of hogs that did not pass through public stockyards.

The weighted average price per hundred pounds live weight of meat animals, obtained by weighting the monthly farm prices by receipts at principal stockyards were as follows: beef cattle in 1931, \$6.25, in 1932, \$4.85; veal calves in 1931, \$7.59, in 1932, \$5.40; hogs in 1931, \$6.19, in 1932, \$3.70; lambs in 1931, \$6.60, in 1932, \$5.20; sheep in 1931, \$2.59, in 1932, \$1.90.

The number of hens and pullets in Indiana farm flocks on January 1, 1933, was about the same as a year ago. Egg production during 1932 was slightly below 1931. Layings were unusually heavy during January and February, 1932, due to the extremely mild weather but were light during the latter part of the year. Hatchings were later than usual. Very little storing of eggs was done the past year due to lack of credit and heavy losses suffered by the storage houses the previous two years. This resulted in very low prices during the heavy laying months. Storage stocks of eggs on the first of January, 1933, were unusually light and prices were relatively favorable the last three months of 1932.

MINER M. JUSTIN,  
Agricultural Statistician.

C. D. PALMER,  
Asst. Agricultural Statistician.

## THE PIG SURVEY—INDIANA

December 1, 1932.

The 1932 fall pig crop in Indiana was 21 per cent larger than last year. Practically all of the increase was due to a larger number of sows farrowed, although there was a slight increase in the number of pigs saved per litter. This increase, combined with the indications of the June survey as to the increase in the spring pig crop of this year, gives a total pig crop for Indiana in 1932 about 14 per cent larger than the total in 1931.

The number of sows farrowing in the spring of 1933 is expected to be about 10 per cent larger than in the spring of 1932.
